Onsite Practice Partners Marketing and Communications Plan

With more than a decade of experience, Onsite Women's Health knows that a successful partnership requires every available communication tool be leveraged to promote this new service offering to patients. Initiating communication efforts to build awareness and enthusiasm among patients, providers, staff and local community as soon as possible ensures that the program will be successful.

The following strategies have been successful with practices in the past including:

Mammo with heart Marketing Rollout Initiatives			
	Pre-Launch Implementation Timing	Onsite Support	Practice Role
Website			
Add a landing page to the "Services" tab on your website to showcase Mammo with heart	4-6 weeks pre-launch	Please refer to the Onsite practice templates	Work with web developer to implement on the site
Phone Messaging			
Add verbiage to the on-hold messaging system as another means of informing patients about the new service	4-6 weeks pre-launch	Please refer to the Onsite practice templates	Work with hold messaging vendor to incorporate
Digital Marketing: Email, Patient Portal, Text Blast			
Send email/portal/text blasts out to the patient community announcing the new service	4-6 weeks pre-launch	Please refer to the Onsite practice templates	Work with patient engagement vendor to incorporate
Display 'Coming Soon' collateral pieces	4-6 weeks pre-launch	Order materials and ship to practice	Practice to display materials throughout the office
Send second email/portal/text blast	Once service has launched	Please refer to the Onsite practice templates	Work with patient engagement vendor to incorporate
Include "Mammo with heart is now offered with every mammogram" to all text or email WWE exam appointment reminders	Once service has launched (ongoing)	Please refer to the Onsite practice templates	

CONFIDENTIAL: This document contains proprietary information and is intended solely for your internal use and should not be distributed, copied or disclosed to any unauthorized party without prior written consent. Unauthorized use or disclosure of the contents of this document may result in legal action. Thank you for your cooperation.

Digital Marketing: Letters, Billing Statements			
Reminder Letters: If annual exam reminder letters are mailed, add verbiage about the new service. Example: "Mammo <i>with heart</i> is now offered with every mammogram."	Ongoing	Please refer to the Onsite practice templates	
Billing Statements: Add a "Mammo <i>with heart</i> is now offered with every mammogram" banner at the top of every billing statement that goes out to patients	Ongoing		
Drop off brochures to neighboring primary care offices, breast general surgeons, and OBGYN offices to promote new service	First month of new service		Practice to schedule brochure outreach

Social Media & Google My Business			
Social: If there are active social accounts, post an announcement about Mammo <i>with heart</i> . Refer to the materials for sample language.	One-month pre-launch	Please refer to the Onsite practice templates. Can provide social media graphics	Assign key person in the practice to manage social media posts
Google My Business: Be sure to "Claim this Business" under the Google map location online and Mammo <i>with heart</i> to the services/notes section. This helps drive SEO (search engine optimization).	Claim business as soon as possible. Add service upon launch.		To be completed by assigned practice personnel

If you have any questions or need additional information, please contact us.

We're proud to partner with your practice to advance early detection of breast cancer and breast arterial calcifications (BAC) — helping identify risk sooner and save lives.

Provider and Staff FAQs

What is Mammo with heart?

Mammo with heart is an enhancement to traditional screening mammography that uses FDA-cleared, AI-based software – cmAngio® by CureMetrix® – to identify the presence of Breast Arterial Calcifications (BAC) on a mammogram.

What are Breast Arterial Calcifications (BAC)?

BAC are calcium deposits within the arteries of the breast. While typically benign, research has shown an association between BAC and increased risk of heart disease and stroke.

Does Mammo with heart diagnose heart disease?

No. Mammo with heart does not diagnose heart disease. It identifies BAC, which may indicate increased cardiovascular risk and help inform whether further evaluation is appropriate.

Does this change the mammogram exam for patients?

No.

- No additional imaging
- No additional appointment
- No added radiation
- No added effort for the patient

Who interprets the results?

BAC findings are reviewed by our team of breast-specialized radiologists as part of the mammogram interpretation.

What happens if BAC is identified?

Breast arterial calcifications are one of many risk indicators. If BAC is present, the patient's provider should review appropriate next steps with the patient based on individual factors and clinical judgment.

Are there any patient populations for whom this service has not been established or validated?

The effectiveness of cmAngio in patients with devices (e.g. pacemakers), implants, and other foreign artifacts, along with visible breast trauma or injury has not been established. Therefore, patients with any of these conditions should not be offered cmAngio BAC analysis.

How should staff explain Mammo with heart to patients?

Mammo with heart is an added layer of insight from your mammogram that looks for signs that may be linked to heart health—without requiring extra time or radiation.

Is there a cost for the patient?

Yes, Mammo with heart is optional but is not yet covered by insurance. Therefore, any patient who opts in will pay out of pocket for the additional study. The current price is (XXX). (customizable by practice)

[Insert practice name] is proud to offer Mammo *with heart*, an innovative enhancement to traditional mammograms that can detect early heart disease risk. It detects the presence of Breast Arterial Calcifications (BAC) – a calcium buildup in the breast’s arteries that can indicate increased risk of heart disease.

While BAC is usually benign, its presence may indicate arterial stiffening and increased pressure on blood vessel walls, potentially signaling issues in other areas that may require further evaluation. If BAC is present, discussing any necessary follow-up with your provider or specialist is recommended.

This proactive approach, using advanced AI technology, ensures you’re prioritizing both breast and heart health in one comprehensive screening.

Key facts:

- FDA-cleared AI-based detection software for identifying Breast Arterial Calcifications in mammograms
- BACs are linked to an increased risk of heart disease and stroke, making detection crucial for patient health
- Determine if further evaluation is recommended
- No additional effort for you
- No additional radiation

Frequently Asked Questions

What is Mammo with heart?

Mammo with heart is an enhancement to traditional screening mammography that uses FDA-cleared, AI-based software - cmAngio® by CureMetrix® - to identify the presence of Breast Arterial Calcifications (BAC) on a mammogram.

Is this new screening FDA-approved?

Yes, the breast arterial calcification detection software that Onsite Women's Health uses is FDA-cleared.

What is Breast Arterial Calcification (BAC)?

Breast Arterial Calcifications (BAC) is a calcium build-up in the arteries of the breast. The calcium deposition leads to arterial stiffening and increased pressure on the vessel walls. This is regularly observed on screening mammography.

Why does BAC identification matter?

Based on current research and published literature, Breast Arterial Calcifications (BAC) is currently considered to be a benign incidental finding without defined clinical importance to breast cancer screening. However, there is growing evidence that it is associated with other vascular calcifications and associated clinical outcomes. Patients identified with BAC may be candidates for additional clinical evaluation of general health.

How is it detected on my mammogram?

The cmAngio software reads your mammograms to determine the presence or absence of breast arterial calcification. An expert radiologist will review your results to confirm the findings.

Is an additional mammogram screening needed?

No. With cmAngio, a screening mammogram serves as a two-for-one exam with no additional screening and no additional radiation.

If I have BAC present, should I be concerned?

If you have a lot of breast arterial calcifications (BAC), it may not be immediately concerning on its own. However, it's important to consider this in the broader context of your health. Factors such as age, medical history, family history of conditions like breast cancer or heart disease, as well as other risk factors like diabetes, high cholesterol, and blood pressure, should be considered. A comprehensive assessment that considers these factors is advisable to determine if further evaluation for arterial calcifications is needed.

How often should I get this assessment?

We recommend you repeat the screening every year with your annual mammogram.

I already see a cardiologist, do I still need BAC monitoring?

BAC screening is primarily used to identify patients at risk for cardiovascular disease who otherwise may not know that they are at risk. Patients currently under the care of a cardiologist should consider discussing this assessment with their doctor first. There's no harm in having the BAC screening done, but benefits are still unknown for patients already being treated for cardiovascular disease.

Are there ages where this assessment makes sense? Am I too old or too young for Mammo with heart?

All women may benefit from a Mammo with heart assessment regardless of your age. Identifying risk factors for your health is important at any age.

Are there any patient populations for whom this service has not been established or validated?

Patients with breast implants or any other devices in the chest, such as pacemakers, should not opt-in for Mammo with heart.

Is it covered by insurance?

Mammo with heart is optional but is not yet covered by insurance. Therefore, any patient who opts in will pay out of pocket for the additional study. The current price at [Practice Name] is \$[insert price].

How do I request Mammo with heart?

Contact our practice, or let the front desk know at check-in.

Project: Referring Physician Email or Letter Template

Subject: Announcing Mammo *with heart*: New AI-Enabled Insight from Screening Mammography

Dear Referring Physician,

We are pleased to announce the upcoming launch of Mammo *with heart*, a new service powered by cmAngio® by CureMetrix®, at the following locations:

[Insert Locations]

This service is expected to be live beginning **[Insert Date]**.

Mammo *with heart* is an innovative enhancement to traditional screening mammography that leverages cmAngio®, an FDA-cleared, AI-based software solution that detects the presence of Breast Arterial Calcifications (BAC) directly from a standard mammogram. No additional imaging, radiation or patient appointment is required.

cmAngio® automatically generates a structured scorecard for review by the breast-specialized radiologist, enabling consistent identification and documentation of BAC findings. As supported by published research, empowering women and their care teams with this information may support more informed cardiovascular risk discussions when clinically appropriate.

How Mammo *with heart* may benefit your patients:

- Identifies patients with BAC who may benefit from further clinical consideration based on age, medical history and overall risk profile—patients who might otherwise go undetected
- Enables longitudinal comparison of BAC findings over time to help assess changes in a patient's health profile
- Provides visual context that may support patient understanding, engagement and adherence to recommended lifestyle changes or follow-up care

Impact on Referring Physician Workflow

We recognize the importance of balancing clinical insight with workflow efficiency. cmAngio® offers an adjustable operating point that allows sensitivity to be aligned with defined clinical goals. While we anticipate that the increased consistency and sensitivity of AI-assisted detection may identify more patients with BAC present, we do not expect more than approximately 15–20% of screened patients to be identified, with only a subset requiring referral to their **(practice to customize based on group type)**.

Our goal with Mammo with heart is to provide meaningful, actionable information—without unnecessary burden—while supporting a proactive, preventive approach to women’s health.

If you have any questions about this service or would like additional information, please do not hesitate to reach out. We are happy to discuss clinical workflows, reporting, or implementation details.

Sincerely,

[Executive Sponsor Name]

[Title, e.g., CEO, Practice Administrator]
