MAMMO
with heart

Insight into **breast** and **heart** health with **one exam.**

[Insert practice name] is proud to offer Mammo *with heart,* an innovative enhancement to traditional mammograms that can detect early heart disease risk. It detects the presence of Breast Arterial Calcifications (BAC) - a calcium buildup in the breast's arteries that can indicate increased risk of heart disease.

While BAC is usually benign, its presence may indicate arterial stiffening and increased pressure on blood vessel walls, potentially signaling issues in other areas that may require further evaluation. If BAC is present, discussing any necessary follow-up with your provider or specialist is recommended.

This proactive approach, using advanced AI technology, ensures you're prioritizing both breast and heart health in one comprehensive screening.

Key facts:

- FDA-cleared AI-based detection software for identifying Breast Arterial Califications in mammograms
- Provides key heart health information to your breast-specialized radiologist
- BACs are linked to an increased risk of heart disease and stroke, making detection crucial for patient health
- Determine if further evaluation is recommended
- No additional effort for you
- No additional radiation
